

After watching the phone bands in Amateur service become over crowded with so many phone operators I would suggest that the FCC consider making the phone portion of the 75/80m band extend down to 3.6 Megacycles there by relieving the over crowding we are experiencing today. The current trend is going further and further away from "CW" therefore the band needed for this mode should correspondingly be reduced and more forward thinking be implemented to encourage use of the bands.

Respectfully,

Tony M. Cypert
